if you get an error while running

```
cd ~/.rbenv && src/configure && make -C src
```

ignore it

after exiting back to root user from setting up bundler, start the db

```
systemctl start postgresql
```

start redis

```
systemctl start redis
```

when starting nginx you may need to comment out these listen lines:

```
listen 443 ssl http2;
listen [::]:443 ssl http2;
```

and add in these lines after

```
listen 443;
listen [::]:443;
```

after getting a cert using certbot, comment out the entire server block that certbot adds to the config file, then return the listen lines to how they were before
